This GSS is part of a random genomic sequencing program of thirteen yeast species: Saccharomyces bayanus var. uvarum, Saccharomyces
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      exiguus, Saccharomyces servazzii, Ingosaccharomyces rouxii, Saccharomyces kluyveri, Kluyveromyces thermotolerans, Kluyveromyces lactis var. lactis, Kluyveromyces marxianus var. marxianus, Pichia angusta, Debaryomyces hansenii var. hansenii, Pichia sorbitophila, Candida tropicalis and Yarrowia lipolytica. Genomic inserts of 3 to 5 kb were prepared and both extremities were sequenced. See keywords for description of this sequence and for the sequence of the other extremity of this insert.

/note="vector: pBluescript SK: Site_1: EcoRI; site 2:
XhoI; cDNA was prepared from polyA+ enriched RNA from
roots harvested at 10, 17, 22, 31 and 38 days
post-incculation with Glomus versiforme. The cDNA was
directionally ligated into the Unizap XR vector from
stratagene and packaged using Glogapack III Gold packaging
extracts. Plasmids containing cDNA inserts were excised
from the recombinant lambda-Zap phage using Ex-assist
helper phage and propagated in XLOLR cells."

/clone_lib="vector: ph051; Site_1: BSt I; Constructed at The
Institute for Genomic Research (TIGR), Rockville, MD.
Genomic DNA isolated from broth cultures of E. histolytica
using a method described by Clark and Diamond (Clark,
C.G., and Diamond, L.S. (1993) Entamoeba histolytica: a
method for isolate identification. Exp. Parasitol.
77:450.). The DNA was mechanically sheared to give a
tight size distribution of 2 kb). The v + i method used for
the library construction is described in detail in Smith,
H.O. and Venter, J.C. (Making small insert libraries for
whole genome shotgun sequencing projects. In Genome
Sequencing: A Practical Approach, eds. M. Vaudin and B.
Barell, Oxford University Press, 1999)."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 δλ
                                                                                                                                                                                                                                                                                                                                                                                                                (http://www.jax.org/nscources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymerase in thigh molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gil4732114)plAR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for amplicillin resistance."

                                                                                                                                       unknown function. The DNA sequence was isolated from a library of clones of S. aureus WCHH 29 in Escherichia coli. The DNA sequence can be used in the construction of ribozymes and antisense sequences to control the expression of Staphylococcal genes. The DNA sequence is also useful as a source of regulatory elements for the control of bacterial gene expression. The present protein may be used to produce antibacterial action. These vaccines and antibodies with antibacterial action. These vaccines and antibodies would protect a host against invasion by S. aureus, and conditions relating to Staphylococcal infection. e.g. Staphylococcal food poisoning, scaled skin syndrome, and toxic shock syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Carr GJ;

prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are becherichia coil, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, Pseudomonas aeruginosa and Enterococcus faecalis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acid sequence is also useful to screen for homologous nucleic acid sequence is also useful to screen for homologous nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein.

Note: The sequence data for this patent did not form part
format directly from WIPO at the printed specification, but was obtained in electronic format directly from WIPO at the printed specification, but was obtained in electronic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                An artificial polynucleotide encoding an HN and/or F polypeptide of Newcastle Disease Virus (NDV) DNA, a bioprecursor of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Newcastle disease virus gene clones - comprise polynucleotide(s) encoding the HN and/or F protein of Newcastle disease virus RNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           .

The NDY HN and F genes were inserted in the same transcriptional orientation as the ORF in the parental homology vector. The sequence of Sfil fragment is in AAQ68943/RS8858/AARS8859. The inserted Sfil fragment has the following structure: Junction A - Fragment 1 (HN, AAS 2-577) - Junction B - Fragment 2 (F, AAS 1-553) - Junction C - Fragment 3 (pBR322) - Junction D. Fragment 1 is approx, 1811 bp AvaII to NaeI fragment of the NDV HN CDNA clone (B1 strain). Fragment 2 is an approx 1812 bp BamHI to BSII fragment of the full length NDV F CDNA (B1 Strain). Fragment 3 is an approx 235 bp PSII and Scal fragment of the plasmid PBR322. The sequences of the Junctions are in AAQ68945, AAQ68946,
                                                                                                                                                                          Gaps
polypeptide, or an epitopic portion of the polypeptide or an artificial nucleotide complementary to the polynucleotide are claimed. The polynucleotides are useful for preparing a probe for extracting similar genes from a gene library or for identifying the prescence of NDV virons in a sample obtd. from poultry.
                                                                                                                                                                          5,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New recombinant fowl pox virus for use in vaccines - contains genes expressing antigens of Newcastle disease virus and opt. infectious bronchitis virus

Newcastle disease virus (NDV) HN and F genes. The structure of the fragment is: 5' - Junction B - Fragment i (NDV HN AAS 2-577) - Junction B - Fragment 2 (NDV F AAS 1-553) - Junction C - Fragment 3 (pBR322) - Junction D - 3'. Fragment 1 is Avall to Nael fragment of the full length NDV HN cDNA clone (Bl strain). Fragment 2 is BamHI to PStI fragment of the full length NDV FONA (Bl strain). Fragment 3 is a PStI and Scal fragment of pBR322. The structures of the Junctions A, B, C and D are given in AAQ70552, AAQ70553,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ,

```
Recombinant turkey herpes virus (rTH) which comprise a foreign DNA sequence encoding a cytokine inserted into a XhoI site within an BCORI #9 genomic fragment, where the cytokine can be expressed in host calls infected with the virus can be used in vaccines to protect turkeys against avian viruses. The recombinant viruses can be used for immunising birds against infectious bronchitis virus (IBV), infectious bursal disease virus (IBDV), Marek's disease virus (MDV) infectious laryngotrachetits virus (ILV) and Newcastle disease virus (NDV). They may also be used in multivalent vaccines to protect against two or more of these avian viruses. This sequence is the product of the F gene of the Newcastle disease wan antigen which can be used in the recombinant vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

Newcastle disease virus (NDV) haemagglutinin (HN) (AAW10690) and fusion (F) protein (AAW10691) are expressed by novel recombinant (EAW100x virus (FPV). The genes (see also AAT48510) for HN and F can be inserted into homology vector 443-88.8 (see also AAT48511) at the unique sfil site, yladding homology vector 502-26.22 (see also AAT48511) at AAT48502-05), which can be used to insert the NDV HN and F genes into fowlpox virus. The recombinant virus is used to deliver the

The invention relates to a recombinant fowlpox virus (FPV) comprising a foreign DNA inserted into a region of the fowlpox virus genome corresponding to a 2.8 kb EcoRI fragment, capable of being expressed in a host cell. The virus is used as a vaccine for immunising chickens against Newcastle disease virus (NDV), Fowlpox, and infectious Laryngotracheitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      may be used in vaccines to protect animals (especially chickens) against fowlpox and, depending on the source of the foreign DNA, other diseases, particularly Newcastle's disease, Marek's disease or infectious
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     recombinant fowlpox virus (FPV) that comprises a foreign DNA inserted within a 3.5 kb Ecorf fragment of the FPV genomic DNA. The foreign DNA can be expressed in host cells infected with FPV. The recombinant FPV may be used in vaccines to protect animals (especially chickens) agains
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New recombinant fowlpox virus useful as vaccines contains foreign DNA inserted into specific non-essential region of the genome

Also it is possible to generate a stable transfected cell line that expresses the wild-type F protein in the virus envelope therefore providing infectious particles, useful in the form of a vaccine, especially against respiratory and/or gastrointestinal diseases. NDV can be easily cultured to very high titers in embryonated eggs. Mass culture of embryonated eggs is relatively cheap. NDV vaccines are relatively stable and can be simply administered by mass application methods e.g. drinking water or by spraying or by aerosol formation. The natural route of infection is by the respiratory and/or gastrointestinal tract which are also the major routes of infection of many other poultry pathogens. NDV can induce local immunity despite the presence of circulating maternal antibody. This sequence represents a protein encoded by the NDV strain LaSota genome which is described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New avian paramyxovirus cDNA, useful for production of vaccine against
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     comprises a nucleic acid sequence corresponding to the 5' terminal end of the genome of a vian paramyxovirus allowing the generation of an infectious copy of avian-paramyxovirus. The cell line is useful for the production of infectious lentogenic NDV (Newcastle Disease virus)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     invention describes a novel avian-paramyxovirus cDNA (I) which

The invention relates to a recombinant fowlpox virus (FPV)

comprising a foreign DNA inserted into a 4.2 kD ECORI fragment

of the fowlpox virus genome. The foreign DNA is capable of being
expressed in a host cell into which the fowlpox virus has been
introduced and encodes an antigenic protein. The antigenic protein
which may be expressed includes infectious laryngotrachetis virus

(ILTV) glycoprotein B (gB) or glycoprotein D (gD, AAY58184). Newcastle
disease virus (NDV) haemaggluthin (HN, AAY58184) or fusion (F) protein

(IAX'58183) and Marek's disease virus gB or gD. The foreign DNA may
clactor (GMCM) or chicken interferon (cIrN). The foreign DNA may
factor (CMCM) or chicken interferon (cIrN). The foreign DNA in the
factor (CMCM) or chicken interferon (cIrN). The foreign DNA in the
factor (CMCM) or chicken interferon (cIrN). The foreign DNA in the
factor (CMCM) or chicken interferon (cIrN). The foreign DNA in the
factor (CMCM) or chicken interferon (cIRN). The foreign DNA in the
factor (CMCM) or chicken interferon (cIRN). The foreign DNA in the
factor (CMCM) or chicken interferon (cIRN). The foreign DNA in the
factor (CMCM) or chicken interferon (cIRN). The foreign DNA in the
factor (CMCM) or chicken interferon (cIRN). The foreign DNA in the
factor (CMCM) or chicken interferon (cIRN). The foreign DNA in the
factor (CMCM) or chicken interferon (cIRN). The foreign DNA in the
factor (CMCM) or chicken interferon (cIRN). The foreign DNA in the
factor (CMCM) or chicken interferon (cIRN). The foreign DNA interferon
factor (CMCM) or chicken interferon (cIRN). The foreign DNA interferon
factor (CMCM) or chicken interferon (cIRN). The foreign DNA interferon
factor (CMCM) or chicken interferon (cIRN). The foreign DNA interferon
factor (CMCM) or chicken interferon (cIRN). The foreign DNA interferon
factor (CMCM) or chicken interferon (cIRN). The foreign DNA interferon
factor (CMCM) or complete I (LNI). EP2 and LP2 (ARZ4991219.149294).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            foreign DNA flanked by FPV sequences. The recombinant fowlpox viruses of the invention are used as multivalent live vaccines for immunising fowl against Marek's disease virus, NDV, ILTV and/or fowlpox virus. The present sequence represents NDV fusion (F) protein.
                                                                                                                                                                             Fowlpox virus; FPV; recombinant; antigenic protein; expression; infectious laryngotrachetis virus; LIV; Newcastle disease virus; NDV; Marek's disease virus; Cytokine; promoter; homologous recombination; homology vector; multivalent; live vaccine; fusion protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      respectively). The recombinant FPV is generated via homologous recombination between FPV DNA and a homology vector containing the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Recombinant fowlpox virus useful as a vaccine for immunizing fowl against Marek's disease, Newcastle disease, Infectious Laryngotracheitis Virus and/or fowlpox
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    DB 21; Length 553;

AAH52304 to AAH53970 represent nucleic acids (I) encoding polypeptides (II) given in AAG81454 to AAG81320, from Staphylococcus epidermidis.

(I) and (II) can have antibacterial activity and therefore can be used (II) and (II) can have antibacterial activity and therefore can be used to produce the sepidermidis polypeptides (II) wis the production of vectors containing them which are used to produce hosts cells which express the polypeptides. The polypeptides (II) (and/or nucleic acids) may then be used to vaccinate subjects and to raise antibodies against the bacteria. The polypeptides may also be used to assay for other inhibitors of their activity and therefore identify compounds that may be used for the treatment of S. epidermidis infections, e.g. endocarditis, AAH53971 to AAH55090 represent specifically claimed S. epidermidis genomic DNA AAH55094 represent of the present invention. AAH55091 to AAH55094 represent of the present invention. AAH55091 to AAH55094 represent product of the present invention. AAH55094 represent productions and primers which are used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   in the exemplification of the present invention.

N.B. The present invention specifically claims all the polynucleotide sequences given in the sequence listing of the present specification, however the sequence listing only goes up to SEQ ID NO:4454 so even though sequences are given in the disclosure for SEQ ID NO:4465 to 4472, no sequences are present for SEQ ID NO:4455 to 4464.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Nucleic acids encoding polypeptides from Staphylococcus epidermidis, useful for vaccinating against infections, e.g. endocarditis -
                                                                                                                                            epidermidis open reading frame protein sequence SEQ ID NO:1358.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      4

                                                                                                                                                                                     -!- CATALYTIC ACTIVITY: L-glutamate 5-semialdehyde + phosphate + NADPH.
NADP(+) = L-gamma-glutamyl 5-phosphate + NADPH.
-!- ENZYME REGULATION: FEEDBACK REGULATED BY PROLINE.
-!- PATHWAY: FIRST AND SECOND STEPS IN PROLINE BIOSYWHESIS PATHWAY.
-!- TISSUE SPECIFICITY: EXPRESSED AT HIGH LEVELS IN LEAVES AND IS INDUCTBLE IN ROOTS SUBJECTED TO SALT STRESS.
-!- SIMILARITY: IN THE N-TERMINAL SECTION; BELONGS TO THE GLUTAMATE 5-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                     Submitted (MAY-1998) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: P5CS PLAYS A KEY ROLE IN PROLINE BIOSYNTHESIS, LEADING
TO OSMOREGULATION IN PLANTS.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                -i- FUNCTION: Plays an important role in the initiation and regulation of chromosomal replication. Binds to the origin of replication; it binds specifically double-stranded DNA at a 9 bp consensus (dnaA box): 5'-TTATC(C/A)A(C/A)A-3'. DnaA binds to ATP and to acidic phospholipids (By similarity).
-i- SIMILARITY: BELONGS TO THE DNAA FAMILY.
                                                                                                         COFACTOR: PYRIDOXAL PHOSPHATE (BY SIMILARITY).
PATHWAY: EIGHTH STEP IN HISTIDINE BIOSYNTHETIC PATHWAY.
SIMILARITY: BELONGS TO CLASS-II OF PYRIDOXAL-PHOSPHATE-DEPENDENT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

1- FUNCTION: ONE GAP JUNCTION CONSISTS OF A CLUSTER OF CLOSELY PACKED PAIRS OF TRANSMEMBRANE CHANNELS, THE CONNEXONS, THROUGH WHICH MATERIALS OF LOW MW DIFFUSE FROM ONE CELL. TO A NEIGHBORING CELL.

1- SUBGELLULAR LOCATION: Integral membrane protein.

1- SUBCELLULAR LOCATION: Integral membrane protein.

2- TRASUS SPECIFICITY: LIVER, KIDNEY, INTEGRINE, LUNG, SPLEEN,

3- TRASUS SPECIFICITY: LIVER, KIDNEY, INTEGRINE, LUNG, SPLEEN,

3- TOMACH, TESTIS, & BRAIN, BUT NOT HEART & ADULT SKELETAL MUSCLE.

1- SIMILARITY: BELONGS TO THE CONNEXIN FAMILY. BETA-TYPE (GROUP I)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       7 LKNDFK---EIKTDELEIIIGGSGSL-----STFFR-----LFNRSFTQAL 44
